

Fall 2026 Dev Challenge

About our final round:

Congratulations, and welcome! In the dev challenge, we will be providing you with a Figma file that outlines the design of a fictitious product. Your goal, as developers, is to bring this concept to life to the best of your ability! This exercise closely simulates how you will interact with your designer to implement a “project vision.”

This is a software implementation challenge. However, you will be evaluated *holistically* with your background and skillset in mind. **Here, slope is a stronger signal than y-intercept.** (feel free to Google what we mean by this)

This means for those of you without significant software experience, this challenge will be an opportunity to demonstrate your initiative and capability to learn and apply new technologies. With that in mind, please do not stress the objective quality of your product compared to others. Instead, focus on the following traits you can exhibit through your build:

We are looking for devs who:

- Do meaningful research, and can justify their framework decisions in the context of their implementation. This is the highest signal to us that you think “correctly” and can be trusted to navigate ambiguity.
- Demonstrate the confidence to learn and put their best foot forward, even in uncomfortable or ambiguous environments.
- Will “make it happen.”

All of you will be expected to perform at or exceed your skill set as it relates to this specific challenge. If you see fit, take opportunities to go above and beyond in your implementation.

(see more on next page)

All applicants: Please match the front-end of this Figma design as precisely as possible. Attention to detail is extremely important. Now that front-end work is easier with AI, we expect you to link this page to a backend, and make it operational. I should be able to refresh the page, modify some data, etc and it should work like a real app! Refer to your intuition about how the product works to inform this functionality.

For devs with dev experience: We expect a well thought-out database implementation and perhaps some authentication and above-and-beyond features as they relate to the product. “Wow” us!

You will be given until **Thursday @ 8:00 pm** to submit the challenge. Final interviews will commence Thursday/Friday.

In the final interview, we expect you to defend your design. Use every tool (ai coding, etc) at your disposal to build fast, but you must justify your design decisions inside and out!

Looking forward to your submissions!

Figma Link: (don't be overwhelmed, we promise, it's easier than it looks!)

<https://www.figma.com/design/nvpGmK1je0QsesXtZcBdjg/F26-Dev-Challenge-Figma?node-id=0-1&t=Q0CZ3Zhj84ESzX6Z-1>

Submission instructions:

1. Use your (or create a) GitHub account.
2. Create a new repo.
3. Publish your code to this repo.
4. Email us the link to your repo no later than the deadline of **Thursday @ 8:00 pm**.
5. Do not make any new commits past the deadline. We will be verifying.

If you need assistance with GitHub or configuring this properly, please reach out to me, and I will help you. *However, if you have software experience in any capacity, I expect you to be able to use/learn GitHub without any guidance. (This is reasonable.)*
